

Any examinee found adopting unfair means will be expelled from the trimester / program as per UIU disciplinary rules.

There are **SEVEN** questions. **Answer all of them.** Show full simulation and/or solved figures wherever necessary. Figures in the right-hand margin indicate full marks.

 <p style="text-align: center;">Figure 1: An undirected graph <math>G(V,E)</math></p>		
<b>1</b>	<p><b>(a)</b> Find the MST for the given graph in Figure 1 using <b>Prim's algorithm</b>. Show the details of your calculation. Start from <b>node A</b>. <span style="float: right;"><b>[3]</b></span></p> <p><b>(b)</b> Given a weighted graph where multiple edges have the same weight, you are asked to apply <b>Kruskal's algorithm</b> to find MST. You have chosen the merge sort algorithm to sort the edges in ascending order. "<i>Depending on the sequence of the sorted edges, you may have different MSTs</i>". Is the statement <b>True</b> or <b>False</b>? <b>Justify</b> your answer. <span style="float: right;"><b>[1]</b></span></p> <p><b>(c)</b> Suppose you are asked to utilize a disjoint set data structure to implement <b>Kruskal's algorithm</b> to find MST from a given graph. <b>Explain, with an example</b>, how disjoint set data structure would help you to perform the following operations: <span style="float: right;"><b>[2]</b></span></p> <p style="margin-left: 40px;">i) joining two trees in the forest</p> <p style="margin-left: 40px;">ii) detecting a cycle</p>	
<b>2</b>	<p><b>(a)</b> Find the <b>Shortest path tree</b> for the given graph in Figure 2, where the source is vertex <b>y</b>. Show the details of your calculation. <span style="float: right;"><b>[3]</b></span></p>  <p style="text-align: center;">Figure 2: A directed graph <math>G(V,E)</math></p>	

	<p>(b) A graph contains the vertices {A, B, C, D, E, F, G} and the shortest path from A to B is <math>A \rightarrow E \rightarrow C \rightarrow D \rightarrow F \rightarrow G \rightarrow B</math>. Is it possible to find the shortest path from <b>E</b> to <b>F</b> from given data? <b>Justify</b> your answer.</p>	[1]																										
	<p>(c) What do you understand by <i>edge relaxation</i>? Let <math>d(v)</math> be the shortest path estimate from node <math>s</math> to node <math>v</math> and <math>\delta(s, v)</math> be the shortest path value from node <math>s</math> to node <math>v</math>. <b>When does it happen</b> that <math>d[v] = \delta(s, v)</math>?</p>	[2]																										
3	<p>(a) <b>Show</b> the values for <i>finish time</i> (<math>f</math>) and <i>parent</i> (<math>\pi</math>) that result from running Depth-First Search (<b>DFS</b>) on the undirected graph in <i>Figure 1</i>, using vertex <b>A</b> as the source vertex.</p> <p>(b) "Every connected directed acyclic graph (DAG) has exactly one topological ordering" - <b>true</b> or <b>false</b>? <b>Design</b> a graph <math>G</math> with <b>exactly 4</b> vertices that <b>justifies</b> your reasoning.</p>	[3] [2]																										
4	<p>(a) <b>Why</b> do we use the heuristics: <i>union-by-rank</i> and <i>path-compression</i> in Disjoint-Set data structure?</p> <p>(b) <b>Draw</b> the resultant forest after calling <b>UNION(5, 6)</b> and after that <b>draw</b> the resultant forest again after calling <b>FIND-SET(1)</b> on the disjoint-sets of the following figure. You must use the <i>union-by-rank</i> and the <i>path-compression</i> heuristics.</p> <div></div>	[3] [3]																										
5	<p>(a) <b>What</b> is <i>Secondary Clustering</i>? When might a hash table face this suffering?</p> <p>(b) Consider an open-addressing hash table as shown below. The table already contains some data items and other empty slots. Assume that collisions are handled by <b>Quadratic probing</b> using the hash function <math>h(k, i) = (h'(k) + i^2) \bmod 13</math>, where <math>h'(k) = (k + 7) \bmod 13</math>. By showing detailed calculations, <b>redraw</b> the table after</p> <div><p>(i) Insert 47</p><p>(ii) insert 64;</p><p>(iii) delete 12 (replace with NIL);</p><p>(iv) search 38.</p></div> <p>Although 38 had been present at the hash table, your search would fail here. <b>Explain</b> how one can modify the operations such that this will be prevented.</p> <table><tr><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td></tr><tr><td>70</td><td></td><td></td><td></td><td></td><td></td><td>12</td><td>38</td><td></td><td></td><td></td><td></td><td>44</td></tr></table> <p style="text-align: center;">Table: Open Addressing Table</p>	0	1	2	3	4	5	6	7	8	9	10	11	12	70						12	38					44	[1] [1] [1] [1] [1]
0	1	2	3	4	5	6	7	8	9	10	11	12																
70						12	38					44																

6	<p>Consider the mentioned notations  Text, <math>t = \text{"BATMANCATWOMAN"}</math>  Pattern, <math>p = \text{"AT"}</math>  Modulo, <math>q = 13</math>  Hash of a string <math>XY</math>, <math>h(XY) = (X + Y) \bmod q</math> ;  where <math>X</math> and <math>Y</math> are the alphabetical sequence of keys [<i>i.e.</i>: <math>A = 1, B = 2, C = 3, \dots Y = 25, Z = 26</math> etc]</p> <p>Now answer the following questions using <b>Rabin-Karp</b> String matching algorithm:</p> <p>(a) <b>Show</b> the indices of <i>valid hit</i> and <i>spurious hit</i> (if any) using the aforementioned hashing function.</p> <p>(b) What is the time complexity of this algorithm? <b>Explain</b> how it improves the naïve string-matching algorithm?</p>	<p>[2+1]</p> <p>[2]</p>
7	<p>(a) When does a problem belong to the complexity class NP? How does it differ from P class problems?</p> <p>(b) "<i>Being <math>P \neq NP</math> drives the world economy and gives the modern Password protection system a profound advantage.</i>" Do you <b>agree</b> with this? Briefly <b>explain</b> your opinion.</p>	<p>[2]</p> <p>[4]</p>
