

United International University (UIU)

Dept. of Computer Science & Engineering (CSE)

Final Exam Total Marks: **40** Spring 2023

Course Code: CSE 2217

Course Title: Data Structure and Algorithms II

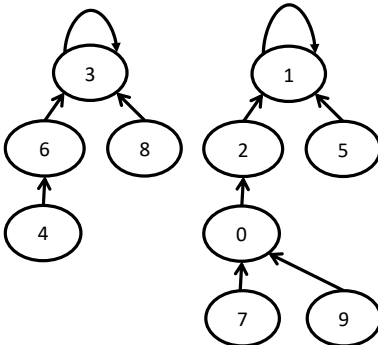

Time: **2 hours**

Any examinee found adopting unfair means will be expelled from the trimester / program as per UIU disciplinary rules.

There are **six** questions. **Answer all of them.** Show full simulation/tabulations wherever necessary. Figures in the right-hand margin indicate full marks.

| | | |
|----|--|----------------------------------|
| 1. | <p>(a) Find the Minimum Spanning Tree (MST) for the given graph in Figure 1 using Kruskal's algorithm. Show the details of your calculation.</p> <div data-bbox="462 653 1193 1041" data-label="Diagram"> </div> <p style="text-align: center;">Figure 1</p> <p>(b) Given a weighted graph where multiple edges have the same weight, you are asked to apply Prim's algorithm to find MST. “Depending on the choice of edges (from edges with same weight), you may have different MSTs”. Is the statement True or False? Justify your answer with an example.</p> <p>(c) Suppose you are asked to utilize a disjoint set data structure to implement Kruskal's algorithm to find MST from a given graph. Explain, with an example, how disjoint set data structure would help you to perform the following operations:</p> <ol style="list-style-type: none"> joining two trees in the forest detecting a cycle | <p>[2]</p> <p>[2]</p> <p>[3]</p> |
| 2. | <p>Consider the mentioned notations:</p> <p>Text, $t = \text{"BATMANCATWOMANSUPERMAN"}$</p> <p>Pattern, $p = \text{"MAN"}$</p> <p>Modulo, $q = 11$</p> <p>Hash of a string XYZ, $h(XYZ) = (X + Y + Z) \bmod q$;</p> <p>where X, Y, and Z are the alphabetical sequence of keys [i.e.: A =1, B=2, C=3, ... Y=25, Z=26]</p> <p>Now answer the following questions using Rabin-Karp String matching algorithm:</p> <p>(a) What is “spurious hit”? Explain with an example.</p> | <p>[1]</p> |

| | | |
|----|--|--|
| | <p>(b) Show the indices of <i>valid hit</i> and <i>spurious hit</i> (if any) using the aforementioned hash function. [3]</p> <p>(c) What is the time complexity of this algorithm? Explain how it improves the naïve string-matching algorithm? [2]</p> | |
| 3. | <p>(a) Consider the graph in Figure 2 and answer the following questions:</p> <div data-bbox="553 401 1084 863"> </div> <p style="text-align: center;">Figure 2</p> <p>i) Find out the Shortest Path to every Node considering 'a' as Source Node using Dijkstra Algorithm. Show all the steps/ calculations. [3]</p> <p>ii) Can we find the shortest path from a Source Node to Destination Node using the MST of the graph? Explain your answer. [1]</p> <p>(b) Find the Shortest path tree for the given graph in Figure 3 using the Bellman-Ford algorithm, where the source is vertex 'b'. Show the details of your calculation. [3]</p> <div data-bbox="561 1276 1089 1801"> </div> <p style="text-align: center;">Figure 3</p> | |

| | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|---|--|---|----|---|---|---|----|----|---|---|---|-------|--|--|--|----|--|--|--|----|----|--|---|
| 4. | <p>(a) Show the status of Figure 4 after each of the following operations:</p> <ul style="list-style-type: none">i) Make_set(10)ii) Find_set(0)iii) Find_set(9)iv) Union(4,5). <p>Note that the operations are executed sequentially. You must use the union-by-rank and path-compression heuristic.</p> <div style="text-align: center;"></div> <p style="text-align: center;">Figure 4</p> | <div>[1] [1] [1] [2]</div> | | | | | | | | | | | | | | | | | | | | | | |
| | <p>(b) In the Disjoint-Set Forests data structure, why do we use path-compression heuristic? Explain with an example.</p> | <div>[2]</div> | | | | | | | | | | | | | | | | | | | | | | |
| 5. | <p>(a) Consider an open addressing hash table as shown below with the following items added beforehand.</p> <table border="1" style="margin-left: auto; margin-right: auto;"><tr><td>Index</td><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td></tr><tr><td>Value</td><td></td><td></td><td></td><td>26</td><td></td><td></td><td></td><td>14</td><td>44</td><td></td></tr></table> <p>This function uses the following hash function to manage collisions:</p> $h(k, i) = (h_1(k) + i h_2(k)) \bmod 10$ <p>Where, $h_1(k) = (3k + 5) \bmod 10$ and $h_2(k) = (2k + 3) \bmod 10$</p> <p>Now, show calculations for the following operations and redraw the given hash table after the insertions.</p> <ul style="list-style-type: none">i) Insert 72ii) Insert 64iii) Search 44 <p>(b) If you try to insert the value 16 in the hash table calculated from 4(a), you wouldn't be able to. Explain why this is the case and how you would solve this problem.</p> <p>Note: You are not allowed to switch from double hashing to any other technique.</p> | Index | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | Value | | | | 26 | | | | 14 | 44 | | <div>[2] [2] [2]</div> <div>[1]</div> |
| Index | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | | | | | | | | | | | | | | |
| Value | | | | 26 | | | | 14 | 44 | | | | | | | | | | | | | | | |
| 6. | <p>(a) While running DFS, what is the maximum possible discovery and finishing time for a graph with 7 nodes?</p> <p>(b) What is a DAG in Graph Theory? How can you determine if a graph is a DAG or not?</p> | <div>[1] [2]</div> | | | | | | | | | | | | | | | | | | | | | | |

(c) Sort the vertices of the Directed Acyclic Graph (DAG) of Figure 5 using topological sorting. You may start from any node.
