

## United International University School of Science and Engineering

Final Exam Trimester: Spring 2023
Course Title: Calculus and Linear Algebra

Course Code: Math 2183 Marks: 40 Time: 2 Hours

## (All the questions are of equal marks. You are requested to answer all the questions in order)

Q1 (a) Farid goes shopping and buys three different types of fruit. The first matrix below shows the number of kilograms of each fruit bought during two different weeks. The second matrix shows the price per kilogram, in cents of each-fruit.

bananas apples grapes price/kg

Week 1 (D) (2) 0.5 (1.5 1 1) time (290 to bananas apples grapes

Given that,  $F = \begin{pmatrix} 1 & 2 & 0.5 \\ 1.5 & 1 & 1 \end{pmatrix} \begin{pmatrix} 290 \\ 160 \\ 640 \end{pmatrix}$ .

(i) Find the value of F and interpret the result.

(ii) Using matrix multiplication find the total amount spent on fruits for two weeks.

3+11

(b) Given that,

$$2x + 3y - z = 5$$

$$x - y + 2z = 0$$

$$-3x + y + z = 8$$

$$\omega e \in \mathbb{Z}$$

(i) Write the above system of linear equations in the form AX = B, where A, X and B are matrices.

(ii) Find the inverse of A and hence solve the above system of linear equations.

[2+4]

Q2 (a) State (do not solve) how many solutions does the following set of equations have?

$$x + 3y - z = 5$$
$$x + y + 2z = -3$$

(b) Find the Eigenvalues and corresponding Eigenvector of the Matrix  $A = \begin{bmatrix} 1 & 0 \\ A & -2 \end{bmatrix}$ .

(c) Solve the following system by Gauss-Jordan elimination method.

$$x-y+2z+3p+t=33x+y-2z+p-4t=0-x+2y-z-p+2t=-1$$
 [1+4+5]

P.T.O

- (a) The roots of the characteristics equation of a differential equation are -2, -2, and Q3  $1 \pm i\sqrt{2}$ . Find the general solution of the differential equation.
  - (b) Solve the following differential equations.

(i) 
$$2xy dx + (x^2 - 1)dy = 0$$

(i) 
$$2xy dx + (x^2 - 1)dy = 0$$
  
(ii)  $(x^2 + y^2)dx + (x^2 - xy)dy = 0$ 

[2+4+4]

(a) Suppose a string is stretched and then released. The motion of the spring is affected by an external force  $f(t) = e^{-3t}$ . The position x of the mass at any time t starts from the equilibrium position is given by the differential equation. Q4

$$\frac{d^2x}{dt^2} + 4 \frac{dx}{dt} + 4x = e^{-3t}$$
Find the position x of the mass at any time t.

(b) Find the solution of the initial value problem

$$4y'' - 8y' + 3y = 0$$
  $y(0)$ 

$$y(0) = 2$$
  $y'(0) = \frac{1}{2}$ 

[5+5]
